Museum Collection and Exhibit Management System

Developed for Tubigon's Museum

Mike Justine D. Palapar • BSIT 3 – Batch 1

The Problem

- Artifacts, exhibits, and loan requests are tracked by hand
- Records are hard to update
- Loan requests are hard to monitor

Goals

- Keep all collection records in one place
- Make exhibits easy to manage
- Let staff request loans and let the administrator track decisions

Users and Features

Administrator

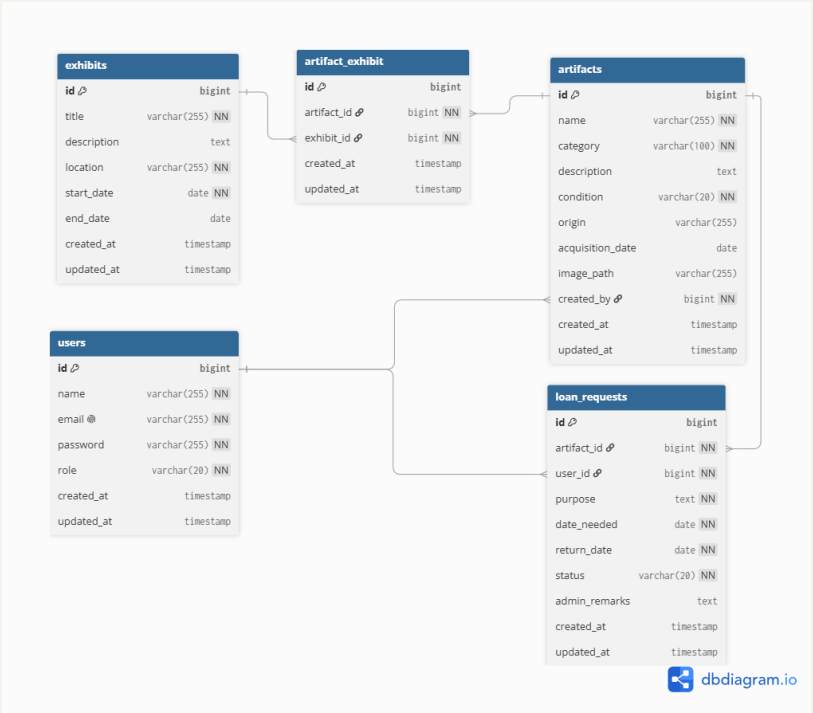

- Manages users and artifacts
- Manages exhibits
- Approves or rejects loan requests

Museum Staff

- Browses and searches artifacts
- Manages exhibits
- Submits and tracks loan requests

Dashboard, search, filters, and pagination for everyone

How It Works

The screens you see talk to a secure server, which stores everything in a database.

React app → Laravel API → MySQL

Security

- Login with secure tokens
- Admin pages are hidden for staff and blocked by the server
- Forms are checked on screen and again on the server
- Confirmation before anything is deleted

Delivered vs. Proposal

- ✓ Login, register, and role-based access
- ✓ Artifact and exhibit management
- ✓ Loan workflow: pending → approved / rejected → returned
- ✓ Dashboard with summary figures
- ✓ Search, filters, and pagination

Limitations and Phase 2

- No artifact photos yet
- No email notifications
- No public page for visitors
- No PDF or CSV reports
